Thank You

We are glad you joined us today. We pray that you will experience God's presence as we share the wisdom found in HIS WORD.

This is the day the LORD has made. We will rejoice and be glad in it.

Psalm 118:24

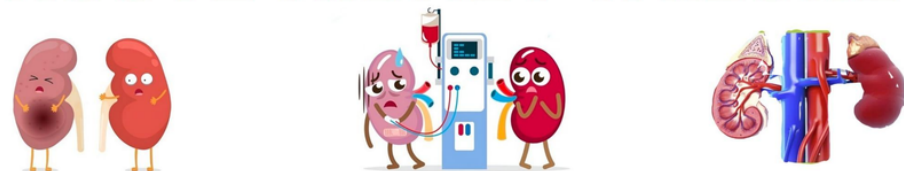

March 22, 2026

Sunday Morning Worship	8:00am
Sunday School	10:00am
Spanish Ministry	11:30am
Tuesday Night Prayer/Bible Class	7:00pm
Thursday Oh What A Fellowship	10:00am

ACUTE KIDNEY FAILURE

Acute kidney failure is a health condition that happens when the kidneys suddenly stop working properly, usually within hours or a few days. This is a serious problem demanding immediate medical attention. There are many possible causes of this disease, but let's focus on two. Creatinine is a waste product produced, when you use your muscles doing energetic activities. Creatinine is transferred in circulating blood, going to the kidneys for removal with urine from the body. When creatinine levels become higher in the urine, it is a marker indicating there are high levels of waste or toxin build – up, accumulating in the kidneys that can lead to kidney failure. This is the main reason why doctors request a urine creatinine level, to be done once or twice a year, especially when you get older. Uric acid another chemical, made in the liver and intestine. This occurs after digestion of red meats, certain sea foods such as canned tuna, sardines, trout and others can contribute to gout. A form of arthritis caused by a build-up of uric acid crystals in the joints. This will cause a sudden painful attack. Normally, urine contains dissolved minerals and salts. But, when there is more waste or not enough fluid, these two substances will stick together and form crystals, untreated these crystals will grow into kidney stones, causing severe pain in the abdominal area just below rib cage, untreated can be fatal. Other symptoms include fluid build -up causing difficult breathing, swelling of legs and feet, weakness, confusion, loss of appetite and irregular heartbeats. When symptoms occur notify your doctor immediately.
