# HANTAVIRUS vs COVID-19

## Understanding the Difference

Hantavirus and Covid -19 are viral illnesses that affect the lungs. But they are caused by different viruses and spread in different ways. **GOOD TO KNOW:** Hantavirus is the name of a family of viruses, that were first identified during a research study of a Korean hemorrhagic fever. Resulting from human interaction with rodents. Covid - 19 remains with no definitive conclusion, on how it began. Some researchers are still working on the idea; this disease came from viral infected animals. While others believe covid - 19 is the accidental escaped virus from a laboratory study. This theory still remains questionable, but it has not been ruled out.

**KEY DIFFERENCES:** Source of infection - hantavirus is mainly linked to exposure from infected rodents or their droppings. But the Andes Virus is the only type of hantavirus that is known to spread person to person. Covid - 19 is spread mainly between person to person. Both breathe in contaminated air causing respiratory problems. How common are they - hantavirus infections are rare and growing. Covid - 19 became a global pandemic, infecting millions of people with a high death rate, and is still alive today. Severity - hantaviruses can become severe very quickly with a high fatality rate. Because there is no cure for these viruses, only treat symptoms. Covid - 19 range from asymptomatic to critical illness, with a recovery period due to vaccines and other medications. However, you can get reinfected multiple times with covid - 19. Symptoms - both have flu like symptoms, because of the lung's involvement. Weakness, fever, coughing, sneezing, body aches interfering with normal breathing pattern.

GOOD TO KNOW

“So we fix our eyes not on what is seen, but on what is unseen, since what is seen is temporary, but what is unseen is eternal.”

-2 Corinthians 4:18
