Rheumatoid Arthritis is an autoimmune inflammatory disease, where the body's immune system attack it's own joint tissues. Rheumatoid arthritis (RA) affects the lining of joints and eat away at the bone. This causes painful swelling, leaving the affected joint bent out of shape, without returning back to it's normal shape. This deformity will interfere with daily activities. RA can cause long term damage and increase the risk of heart disease. **GOOD TO KNOW:** RA may affect a few joints, at first. But most often, it will be the small joints of the hands and feet. However, as the disease gets worse, symptoms may spread to more joints. Such as the wrists, elbows, hips, knees and ankles. Most of the time, symptoms affect the same joints on both sides of the body. Rheumatoid arthritis may have periods, when the disease decreases and later becomes more active. This is called flares, also there are periods when there is no pain or swelling, this is remission. Remember, there is no cure for RA. However various treatments and medications can help manage symptoms and improve quality of life.

The cause of Rheumatoid Arthritis is mostly a mixture of genetic changes and factors from outside the body. Certain viral infections may start RA, in people whose genes make them more likely to get RA. Risk factors; includes women are more likely to get RA than men. It can happen at any age mainly older adults and people with a long history of cigarette smoking. Complications includes carpal tunnel syndrome, where the swelling press on the nerve to the hand and fingers. It can also increase the risk of hardened and blocked arteries, thereby causing heart and lung problems. Symptoms includes – painful swollen joints with stiffness, fever, tiredness and poor appetite. Contact your doctor if your pain is uncontrollable.
